

BOOK: HANDBOOK, L. A.

PHASE I BOOK EXPLOITATION SOV/4563

Metody polucheniya i izmereniya radioaktivnykh preparatov; sbornik statey (Methods for the Production and Measurement of Radioactive Preparations; Collection of Articles) Moscow, Atomizdat, 1960. 307 p. Errata slip inserted. 6,000 copies printed.

General Ed.: Valeriy Viktorovich Bochkarev; Ed.: M.A. Saguro;  
Tech. Ed.: N.A. Vlasova.

PURPOSE: This collection of articles is intended for scientific and technical personnel working in the production of radioactive isotopes.

COVERAGE: The collection contains original studies on methods of obtaining and measuring radioactive preparations. According to the foreword, the articles contain new data, and are of theoretical or practical interest to the extent that they discuss methods or give process information. In addition to several survey articles the collection contains discussions on the production of radioactive isotopes and inorganic radioactive preparations, including a number of carrier-free isotopes and several colloidal and other therapeutic preparations. Also discussed are methods for prepar-

ing a number of tagged organic compounds, problems in the analysis of tagged organic compounds, the absolute and relative measurement of activity, and the radiometric analysis of preparations. New instruments and equipment are described and instructions concerning measurement methods and technique are included. V.I. Levin, Candidate of Chemical Sciences, V.P. Shishkov, Candidate of Technical Sciences, I.N. Bukharov, Candidate of Biological Sciences, and V.I. Shostak, Candidate of Chemical Sciences, are mentioned as having helped directly in the selection and preparation of the material for publication. References accompany each article.

"The Change in the Amount of Stabilizers in Triacetate Films During Destruction by Oxidation at Elevated Temperatures," A. A. Freyman, V. A. Bartashov, L. I. Shagalova, N. L. Perfilova, V. D. Kurchenko, Lab of Techno for Moving Picture Film Base, Lenin-grad Inst of Moving Picture Film Engineers

"Zhur Prik Khim" Vol 25, No 8, 884-889

States that stabilizers present in films are subject to chem change to a greater deg than stabilizers in their free form, under similar conditions. The nature of the change in the quantity of phenyl-a-naphthylamine and phenyl-B-naphthylamine is identical in films. During the process of oxidation, the amt of stabilizer changed, whereas there was no thermal decompn of phenyl-B-naphthylamine when heated at 140° C. Intermediate products of the oxidation of aromatic amines were also shown to be stabilizers of triacetate films. The action of oxygen on plasticized, stabilized films, at a temp of 140° C, was studied. The simultaneous presence of a stabilizer (secondary amine) and dibutylphthalate assured a greater resistance of both to the effect of oxygen at high temps.

AUTHOR: Kurchenko, V. I.

TITLE: The Practice of Applying Anode-Mechanical Cutting

PERIODICAL: Stanki i instrument, 1960, No. 8, pp. 35-37

TEXT: The author describes an anode-mechanical disk-type cutting machine of new design, which, compared with similar machines, possess a number of advantages. Most of the deficiencies of other machines of this type, like wedging of the disk, curving of the cut, melting of the metal towards the end of the cutting operation, have been eliminated. The efficiency of this machine is by 2.5-4 times higher than that of other anode-mechanical cutting machines. The increase in efficiency and cutting quality is obtained mainly by the following factors:

1. Using special guides for the cutting disk in the form of ceramic plates fastened to metallic holders. These guides are placed on both sides of the bar to be cut. This arrangement ensures a width of cut of not more than 1 mm and the perpendicularity of the disk in regard to the bar axis during the whole cutting process. It is not expedient to use hard-alloy or other metallic guides in non-conducting holders. 2. The blank to be cut rotates during the operation owing to which a quick-changing contact is ensured between disk and blank, while

Card 1/2

S/121/60/000/008/011/012  
A004/AC02

### The Practice of Applying Anode-Mechanical Cutting

the total contact time is considerably lower. 3. A pneumatic clamping device is used for holding the bars. The efficiency of anode-mechanical cutting is proportional to the current magnitude. A reduction of the width of cut results in a current reduction, while the volume of removed metal decreases accordingly. Therefore, in any given case, the optimum width of cut should be used. For the machine described, the optimum width of disk is 0.8 mm at a current magnitude of 500-800 amp (with d-c supply) and 1,000 amp (with a-c supply). The author presents graphs in which the technical data of ordinary anode-mechanical cutting machines and those of the machine of new designs are compared. In order to warrant an unrestricted removal of chips it is necessary that the axis of the cutting disk is shifted relative to the axis of the blank by more than half of its diameter ( $A > \frac{d}{2}$ ). In this case the chips will flow freely by the descending curve instead of by the ascending one. There are 2 figures. ✓

TITLE: A semiconductor converter of atmospheric pressure quantities

SOURCE: AN SSSR. Sibirskoye otdeleniye. Sibirskiy Institut zemnogo magnetizma, ionosfery i rasprostraneniya radiovoln. Issledovaniya po geomagnetizmu i aeronomii (Studies in geomagnetism and aeronomy). Moscow Izd-vo Nauka, 1966, 156-159

TOPIC TAGS: atmospheric pressure, pressure measuring instrument, semiconductor triode, nonelectric quantity converter

ABSTRACT: Investigations of the intensity of cosmic radiation as a function of atmospheric pressure require the recording of atmospheric pressure quantities at a high level of accuracy. Taking into consideration the accuracy of the existing atmospheric pressure measurement instruments, the present authors confine their study to a development of a converter of atmospheric pressure employing a type SR-A mercury barometer as the sensing element. The converter described is a regenerative sensor, the measuring coil of which is located on the tube of the barometer. The electronic part of the regenerative sensor consists of

Card 1/2

L 45590-66

ACC NR: AT6027224

an amplifier (P403 transistors) with a positive feedback; the maximum sensitivity and stability of the generation frequency are provided by a measuring coil employed as a resonance circuit. Generation is assured by the presence of feedback and the fulfillment of the condition  $K\beta > 1$ ,  $\varphi_1 - \varphi_2 = 0$  ( $A_i\beta_i > 1$ ,  $\varphi_1 - \varphi_2 = 0$ , for transistors). Here,  $K(A_i)$  is the voltage (or current) amplification;  $\beta(\beta_i)$  is the voltage (or current) feedback coefficient. An analysis of the variations in the parameters of individual stages of the converter with temperature variations shows that the regenerative amplifier will be subjected to the influence of the temperature as a result of the change in amplification as well as due to the frequency and phase variations. A precise accounting of the behavior of the regenerative amplifier may be obtained by experimental means; the authors, however, confine themselves to the inclusion of thermostable elements into the circuit. Under the experimental conditions, the results obtained in the measurement of the atmospheric pressure by the converter described agreed practically with the results obtained by means of a mercury barometer. In conclusion, the authors express their gratitude to Yu. I. Trishkina for her assistance in assembling and testing the converter. Orig. art. has: 4 figures. [26]

TITLE: Some Characteristics of Deemulsifiers, Dissolved in Petroleum (O nekotorykh osobennostyakh deemul'gatorov, rastvorimyykh v neftyakh)

PERIODICAL: Khimiya i Tekhnologiya Topliv i Masel. 1958, Nr 10, pp 34 - 36 (USSR)

ABSTRACT: Deemulsifiers are used for dehydration of petroleum and are generally soluble in water (NChK, NKG). The presence of these products in effluents from petroleum refineries makes purification more difficult and also increases the content in organic compounds. Aluminium naphthenate shows good solubility in petroleum. Its preparation was described in detail by Ye. A. Myshkin (Ref. 1). This reagent has been used in the Gor'kiy Petroleum Refinery for the last twenty-five years (up to 1956) and gave good results. It is insoluble in water, and contrary to NChK and sulphonate, it does not pollute the effluents; it is prepared from the alkaline waste products by treatment with aluminium salts which decreases considerably their organic compound content. The Gor'kiy Refinery also produces a sulpho-naphtha deemulsifier from acidic goudrons.

Card 1/4

SOV/65-58-10-7/15

Some Characteristics of Deemulsifiers, Dissolved in Petroleum

Since 1956 the refinery has been processing "Archeda" petroleum which contains very small quantities of naphthenic acids. The petroleum is dehydrated and desalted by washing with hot water in the presence of the sulpho-naphtha deemulsifier. Acidic goudrons obtained during the purification of Archeda distillates also contain surface active substances which are similar to sulpho-acids. The yield of alkaline waste products is considerably lower than during the purification of petroleum which contain a large amount of naphthenic acids, but the quantity of organic substances reaches 50 to 100,000 mg/litre. The authors investigated the possibility of preparing deemulsifiers of the aluminium sulpho-naphthenate type from these waste materials; according to Ye. A. Myshkin this compound is more active than aluminium naphthenate. The Archeda reagent is a very satisfactory deemulsifier and according to the statements by Chemical Engineer Ye. V. Timofeyuk and by the Laboratory Assistant R. Ye. Grigor'yeva it has been used for dehydration of petroleum since April, 1957. However, it causes strong corrosion of the distillation plates, of the walls of the columns, pumps etc., but

Card 2/4

Some Characteristics of Deemulsifiers, Dissolved in Petroleum SOV/65-58-10-7/15

during ordinary temperature conditions this reagent, as well as aluminium naphthenate, does not contain water-soluble acids and does not corrode metals. The thermal stability of the reagent was tested in an Engler apparatus which contained the reagent in solution, and the water-soluble acids were then defined in the distillate and in the residue. It was found that aluminium naphthenate shows thermal stability, and that the aqueous extract, obtained during the distillation up to 350°C, gives a neutral reaction. A reagent produced from alkaline waste materials, according to an analogous method, is decomposed during heating and acid compounds are separated; this causes strong corrosion. It cannot, therefore, be used as a deemulsifier even though good results were obtained during dehydration and salting out processes. At present the alkaline waste materials

TITLE: Lubricating-cooling liquid for cold working of metals, Class 23, No. 173870 [announced by Gorkiy Petrolubricants Factory (Gor'kovskiy neftemaslozavod)]

SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 16, 1965, 62

TOPIC TAGS: cold metal working, lubricating liquid, cooling liquid, cold working metalworking compounds, lubricant  
ABSTRACT: This Author Certificate describes a lubricating-cooling liquid for cold working of metals, based on an aqueous solution of sodium nitrite. To improve the quality of emulsion and its antiscoring properties, ethylene glycol sodium sulfonylate and disodium monohydrogen phosphate are added to the solution. The solution consists of 10-20 wt% ethylene glycol, 1-5 wt% sodium sulfonylate, and 2-4 wt%  $\text{Na}_2\text{HPO}_4$ .

Moscow, Oborongiz, 1958. 171 p. (Series: Bibliotekha rabochego aviat-  
siomnoy promyshlennosti) 7,000 copies printed.

Reviewer: M. I. Kuptsov, Engineer; Ed.: T.M. Kuniyavskaya; Ed. of Publishing  
House: L.I. Sheynfayn; Tech. Ed.: V.I. Oreshkina, Managing Ed.: A.I. Sokolov,  
Engineer.

PURPOSE: This book is intended for workers in precision casting departments  
and shops.

COVERAGE: This book describes the process of precision investment casting,  
its history, the existing methods, and their accuracy; as well as the specific  
features of the process. It also gives information on materials used for  
patterns and molds and their preparation. Various systems of pouring and  
casting are cited, as well as cluster castings and their assembly. Also  
mentioned are the important coating materials, their compositions, appli-  
cation and role in the casting process. Finally, the alloys used in this  
casting method and their properties are specified. No personalities are  
mentioned. There are 24 Soviet references.

AUTHOR: Kossov, M. A. and Kurchman, B. S.  
TITLE: Material for "hot" components of automobile gas turbine engines  
PERIODICAL: Referativnyy zhurnal, otdel'nyy vypusk. 42. Silovyye ustanovki, no. 7, 1962, 36, abstract 42.7.158. "Avtomob. prom-st", no. 10, 1961, 29-33

TEXT: Suggestions are made in the choice of material for "hot" components of automobile gas turbine engines. These suggestions were checked in practice for the HAMH (NAMI) 053 gas turbine of 350 bhp. Due to difficulties in machining high-temperature alloys, it is better to cast stator and rotor heads as well as the ring-shaped parts of the stator heads, of high-temperature alloys by the lost-wax process, which permits the use of alloys having higher temperature-strength. The following alloys are recommended: for rotor blades ВЛ7-20 (VL7-20), ВЛ7-45У (VL7-45U), АНВ-300 (АНВ-300), ЖС-6 (ZhS-6), and ЖС-6К (ZhS-6K); for turbine discs ЭИ-415 (EI-415); EI-481, and EI-787; for stator blades EI-417, VL-7-20, VL7-45U; for components of the combustion chamber and exhaust manifolds ЭЯИТ (EYalT); EI-657, ЭП-26 (EP-26), and EI-417.
